About ME

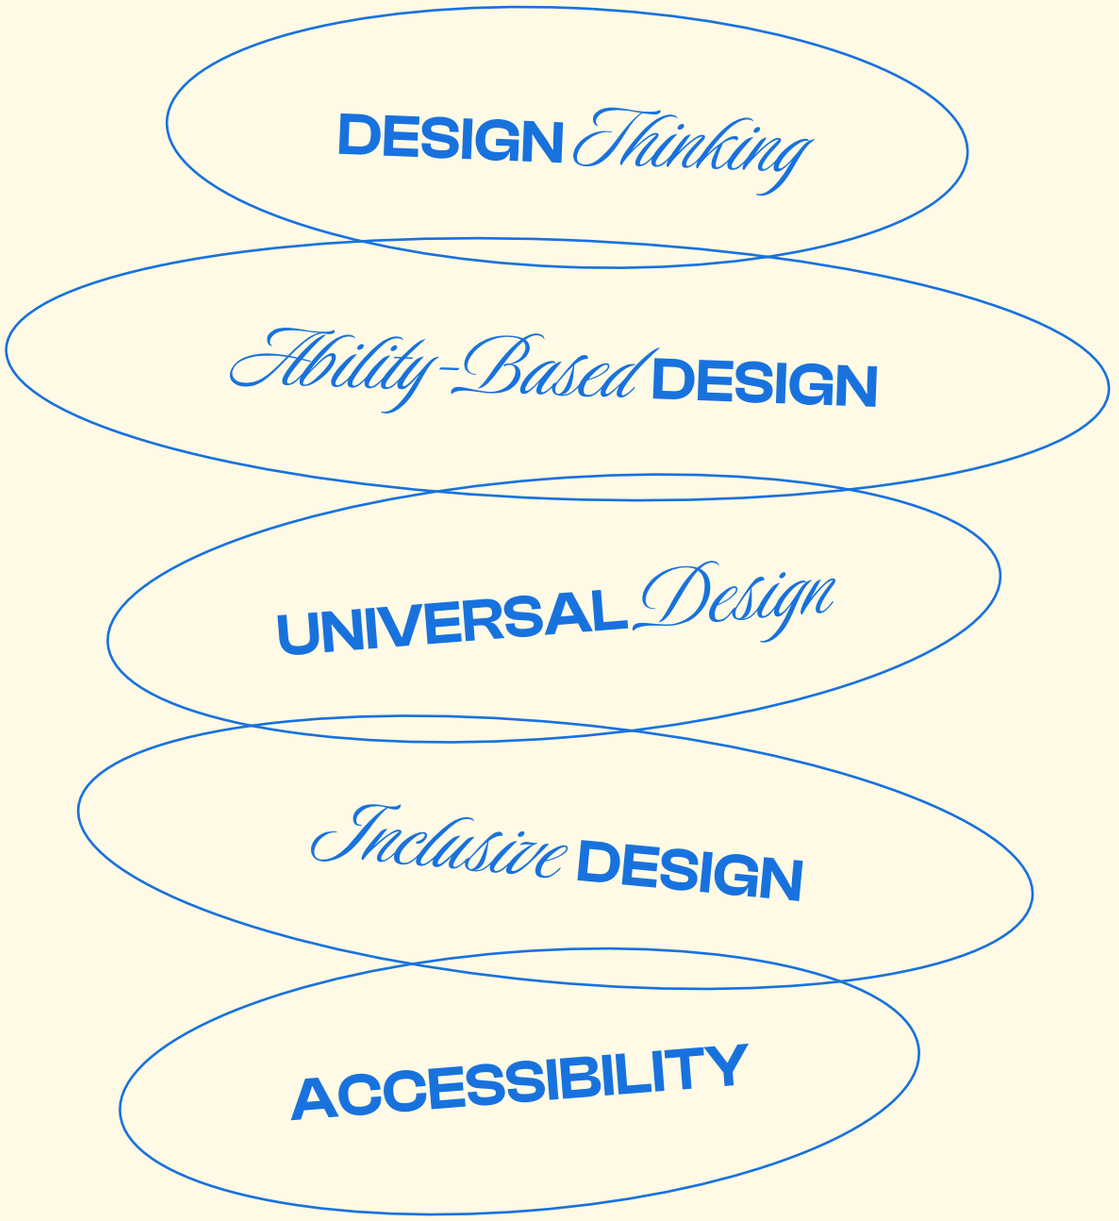

I'm a junior designer and illustrator with a multidisciplinary background in arts, design, and multimedia, with a **particular focus in service design** and children's illustration. I find inspiration in projects that tell stories and bring people together, and I believe design is a powerful tool for accessible and meaningful communication, capable of **creating solutions driven by purpose, creativity, and inclusion**.

I consider myself a **curious, responsible** person with a **great desire to learn, capable of working in a team and dealing with different challenges.**

I have a special interest in the areas of accessibility and universal design, inclusive design, ability-based design and design thinking, which I consider **fundamental to creating truly user-centered digital experiences**. Throughout my academic career, I have sought to integrate these principles into my projects, **valuing research, empathy, and experimentation as an essential part** of the creative process.

Areas of INTEREST

Design PHILOSOPHY

START AT THE *Edges*

I design for the people a project is most likely to exclude. Designing for different abilities, contexts, and levels of familiarity tends to make things better for everyone, not just for those at the margins.

Understand BEFORE SOLVING

I try to **understand a problem before I try to solve it.** The brief is rarely the whole picture. Research and conversation come before visuals.

BE WRONG *Early*

Rough sketches and quick prototypes, tested with real people, tell me more than a polished idea I've only discussed in my head. **I'd rather find the flaw on paper than after launch.**

Accessibility IS A STARTING POINT

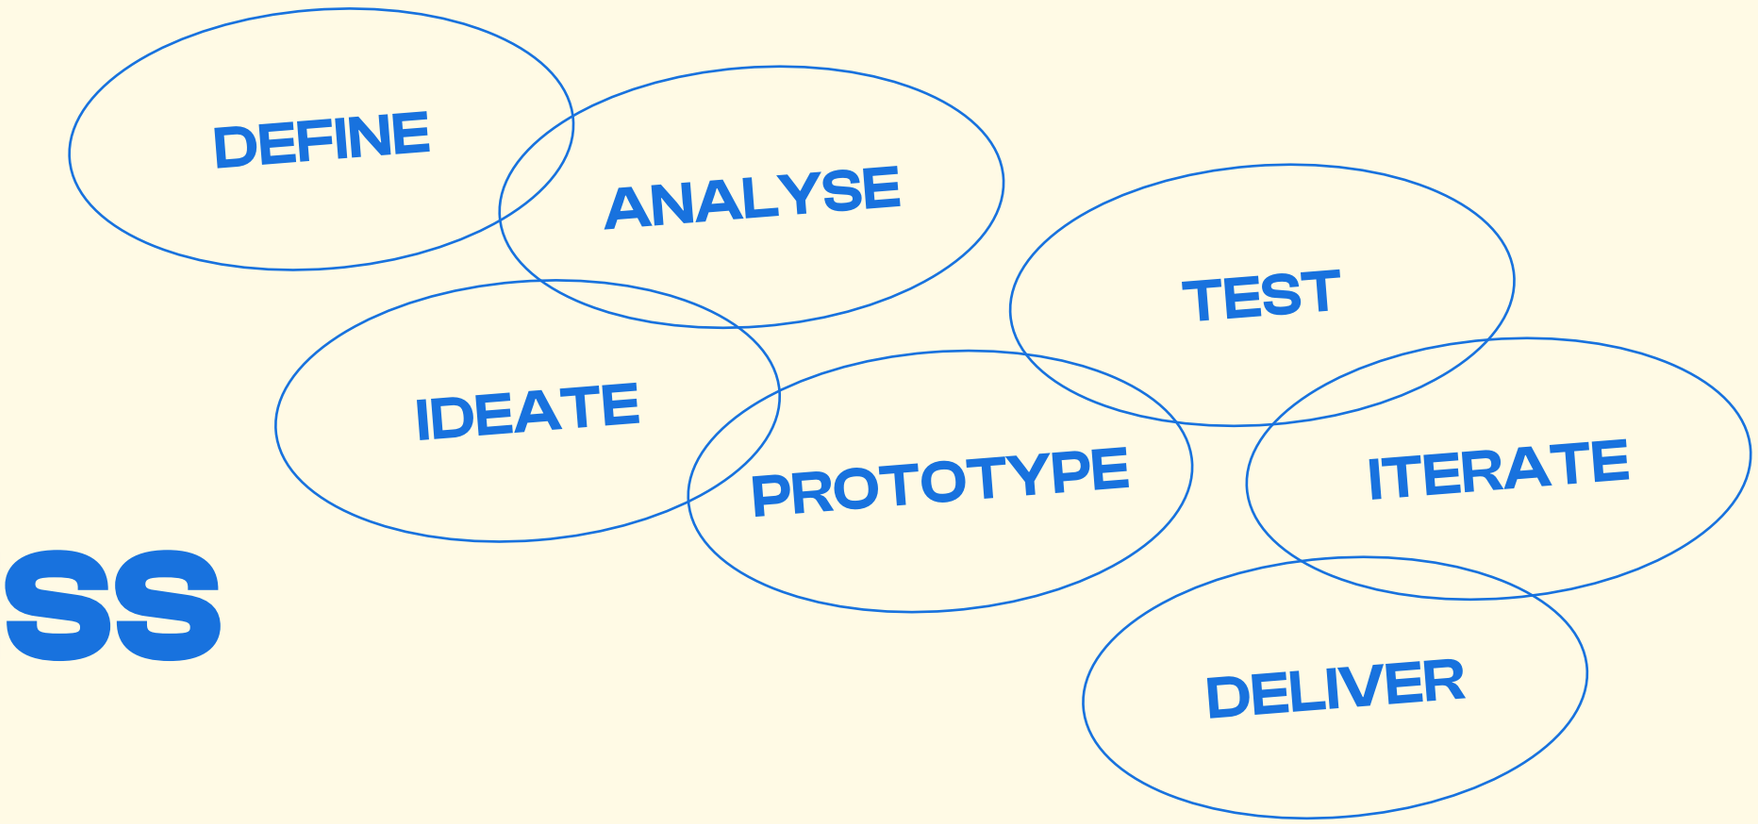

Not a final layer. When accessibility is a condition from the beginning, it stops being a constraint and becomes part of the concept itself.

Question THE BRIEF

The stated problem and the real problem are often different. Part of the job is finding out which one I'm looking at.

1. Define: I start by understanding the problem, not solving it. Research, interviews, competitor analysis, and,when relevant, an early look at accessibility needs, so the direction I choose is based on what's actually there, not on assumptions.
2. Analyse: I turn what I've learned into focus. Personas, user journeys, and a clear problem statement help me decide what the project is actually for.
3. Ideate: I explore before I commit. Sketches, quick brainstorms, moodboards. The goal at this stage isn't the right answer, it's enough options to recognise it when it shows up.
4. Prototype: I give the idea a form people can react to. Wireframes, low or high-fidelity prototypes and early visuals. Something concrete enough to test, not just describe.
5. Test: I put early versions in front of real people before I trust my own judgment of them. Usability tests, quick feedback sessions, or simply watching someone use a prototype without guidance. This is where I find out what actually works, rather than what I assumed would.
6. Iterate: Testing only matters if it changes something. I use what I observe to revisit decisions until the solution holds up outside my own head.
7. Deliver: I hand over the finished work, but I don't consider the project closed until I've looked back at it. What held up, what I'd do differently, that reflection is part of the process, not an afterthought.

Design CASE STUDIES

MEDEOR

KRANEMANN'S
ILLUSTRATION SYSTEM

ABOUT
The impact of end-of-life pharmaceuticals on public health and the environment is a problem that exists primarily because of the users who consume these by products. As such, we have designed a service that addresses and improves this issue, either by raising awareness or by facilitating the process.

PROBLEM SCOPE
The impact of end-of-life medications on public health and the environment, aggravated by poor disposal habits of those that are no longer needed or whose expiration date has passed.

USER/CUSTOMER SEGMENT
1. A user who is aware of the importance of safely disposing of medications.
2. A user who has no knowledge whatsoever about the safe disposal of medications

VALUE PROPOSITION
Secure collection just a click away. Schedule the pickup of your medications from the comfort of your home.

Medeor CASE STUDY

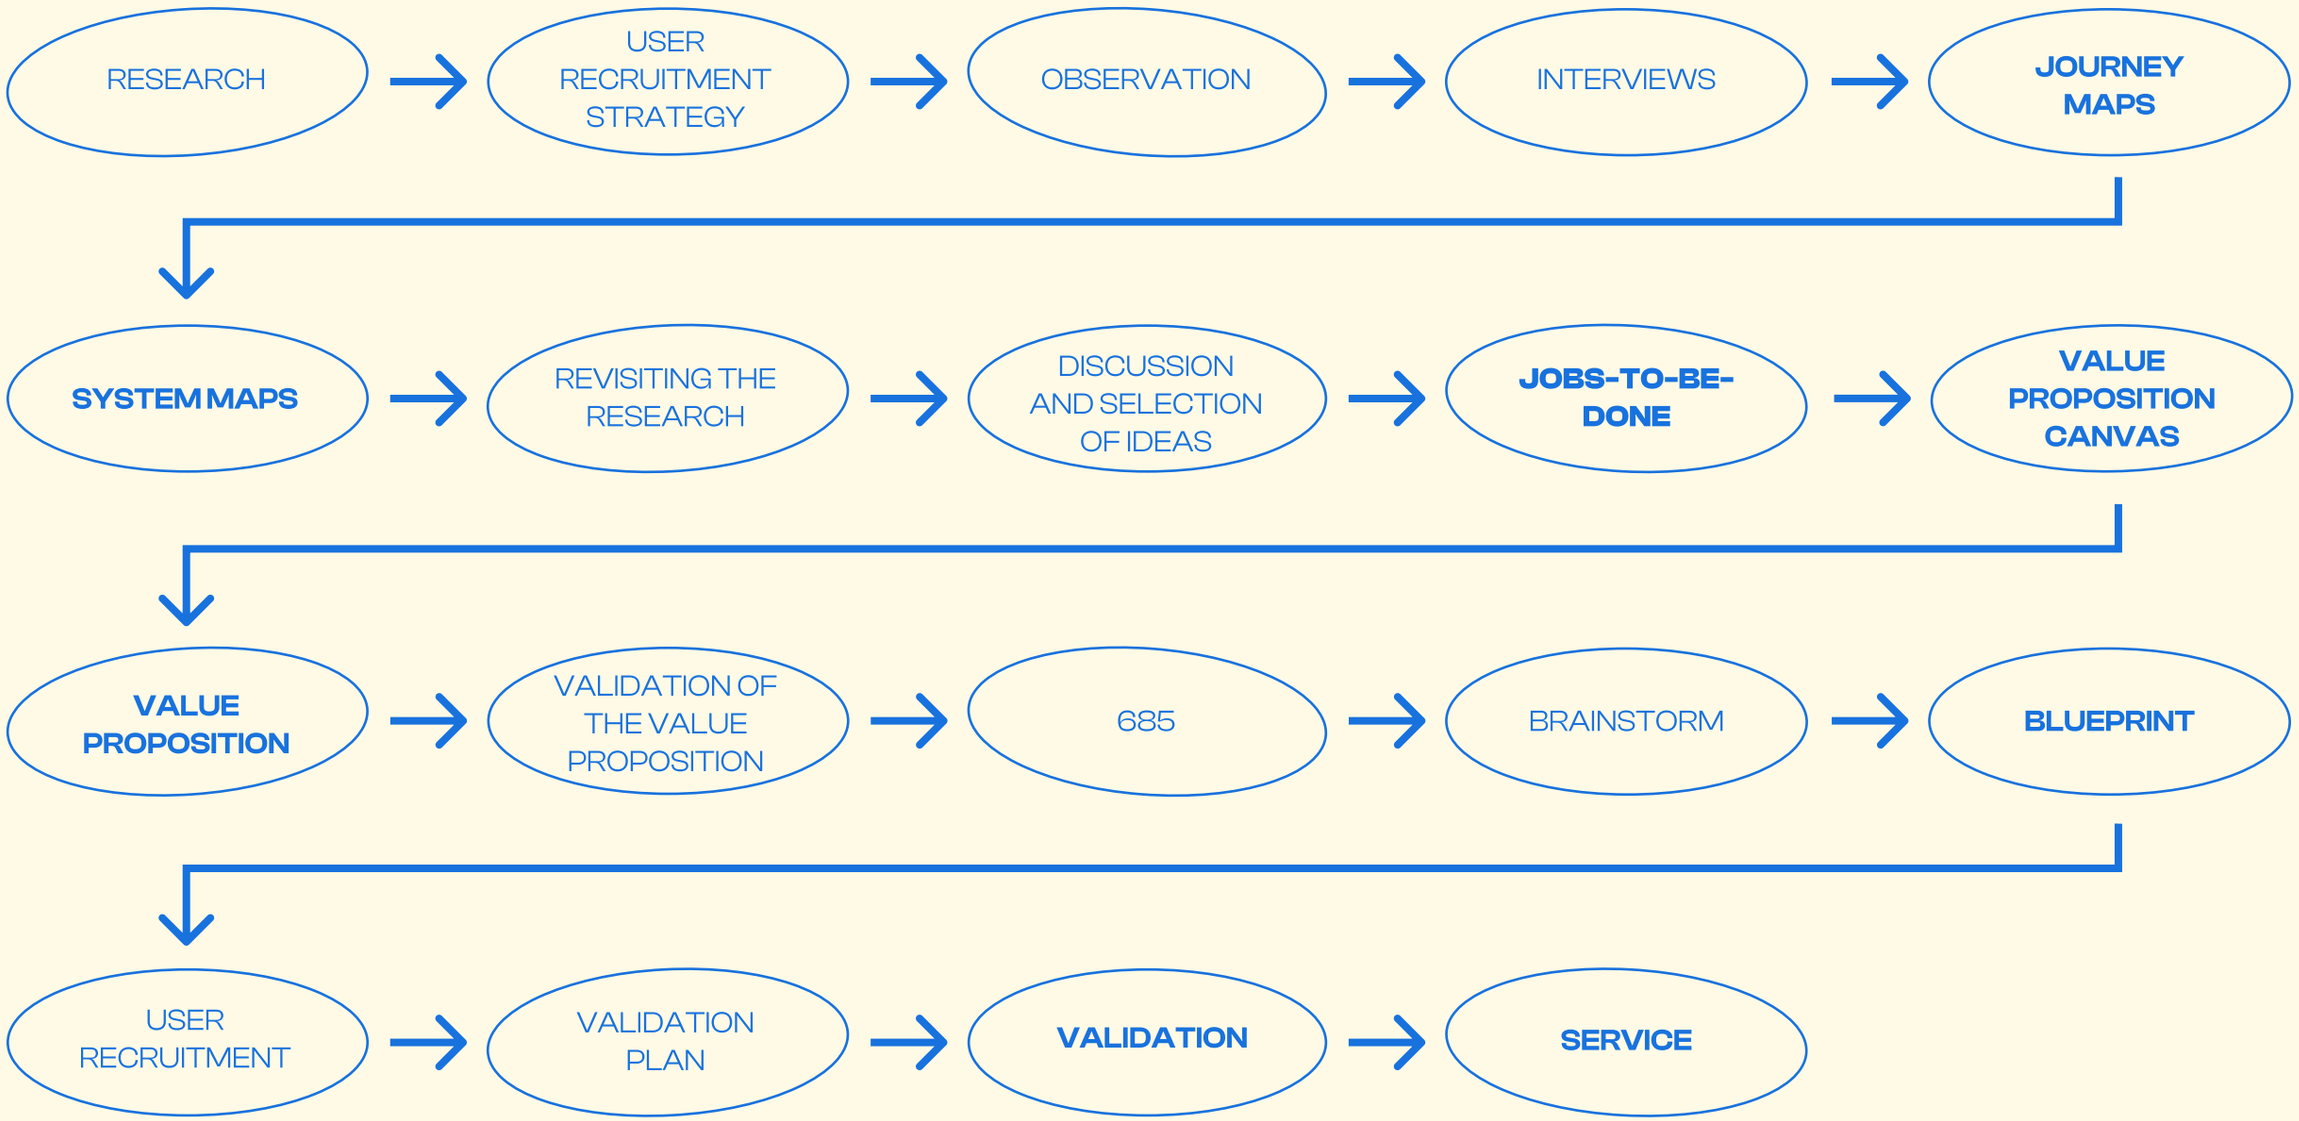

SOLUCTION
Launch of a specialized medication pickup service, available by scheduling an appointment through the webapp.

ABOUT

This project addresses the development of a modular and scalable illustration system applied to Kranemann Wine Estates, a winery located in the Douro region, exploring the strategic role of illustrations in visual brand communication. The study is based on an in-depth analysis of the importance of visual identity in the wine market and how illustrations can reflect the essence of a brand. This system was designed to allow flexibility and customisation in different communication media, respecting the values and characteristics of the Douro terroir.

PROBLEM SCOPE

The difficulty in visually sharing all the stages and respective work processes involved in the production of Port and table wines, from planting the vines to releasing the bottles onto the market. This is a particularly critical challenge when presenting the company's products to intermediate customers.

METHODOLOGY

This project is based on the Double Diamond methodology, a visual representation to better understand the design process. The method is divided into two main phases, Research and Design, which in turn are broken down into four stages: Discover, Define, Develop and Deliver.

NEEDS ASSESSMENT

Company's Current Approach to the Problem → use of generic images from the Wine Folly website.

- Ineffective and Insufficient for Kranemann
- Lack of information about the Port wine production process
- Ultimately, it is an impersonal solution
